Continuation of 11. does NOT place the application in condition for allowance because: The arguments are not convincing. IT is argued that it is not fair to equate the Ohja two-stage anneal process with anneal times over 30 minutes. This and the other arguments regarding two stages over 30 minutes are deemed to be irrelevant. It does not matter that Ohja prefers the short, two stage process; Ohja clear discloses that one can use the conventional long anneal process. From MPEP 2145: A known or obvious composition does not become patentable simply because it has been described as somewhat inferior to some other product for the same use." In re Gurley, 27 F.3d 551, 554, 31 USPQ2d 1130, 1132 (Fed. Cir. 1994)

In a similar matter it is deemed that Applicant's annealing does not warrant a patent just because it is described as being inferior. It is noted that Applicants arguments seem to be limited to only one of Ojha's inventions/embodiments: Col. 2, lines 17- 27 teach another embodiment that is directed to annealing only - there is no indication that such is limited to the quick anneal. See also col. 2, lines 30-32 and 46-48 - it is clear that the cracking is only involved with the driving out of hydrogen. There is no indication that the cracking is a result of the long anneal.

IT is argued that the conventional process of Ohja only contemplated a single anneal after the deposition of the cladding. This is largely irrelevant because the claim only requires a single anneal after that deposition. The other anneal comes before the the cladding deposition.

As to the argument that Ohja teaches away: such is not persuasive. Ohja only discloses that the conventional single-step anneal is somewhat inferior. As to claim objections: there are none.
